

ABSTRACT

A method for wireless data transfer between first and second multimedia devices connected via a wireless connection operated according to a first wireless standard or to a second wireless standard, which are different from and/or not compatible with each other. The method includes: choosing the first wireless standard or the second wireless standard as a chosen wireless standard; processing connection commands, connection parameters, and/or connection data to obtain processed connection commands, processed connection parameters, and/or process connection data of the chosen wireless standard; and sending the process connection commands, process connection parameters, and/or process connection data out via the wireless connection according to the chosen wireless standard. The method thus enables a seamless switching from one wireless standard to another wireless standard, wherein upper layers do not notice the switching.
